

## ZL goes after big data

Sep 27, 2012

ZL Technologies has developed a new application program interface (API) that brings big data capabilities to its ZL Unified Access (UA) solution. ZL UA unifies information management across the enterprise to eliminate data silos by enabling one (and only one data) copy, one consistent search and one control point to coordinate retention policies across the enterprise.

The company says software vendors and enterprises can now use the ZL API kit to manage all its unstructured big data to respond to critical enterprise needs, including:

- regulatory compliance and corporate governance;
- e-discovery, spanning the EDRM spectrum from information management to production;
- records management, including DoD 5015 certification;
- storage management;
- advanced search, parallel search, concept search and text analytics;
- on-premise, cloud or hybrid cloud configuration;
- security, including encryption, authentication, authorization and audit trails; and
- access flexibility, including client, web and wireless devices
